

List of Tables

Description	Page no.
Table 5.6.A: Modified BG Prasad scale (Singh et. al., 2017)	40
Table 5.7.1.A: classification of stress according to CSI values	41
Table 5.7.2.A: Classification of stress (Psychological) according to occupational stress index (Srivastava and Singh, 1984)	42
Table 5.7.3.A: Heat stress situation prediction based on WBGT index, workload and work/rest regime (Source: OSHA, 2017)	43
Table 6.1 A: Height, weight and BMI of the Adult subjects in terms of Mean \pm SD	49
Table 6.1 B: Height, weight and BMI of the children subjects in terms of Mean \pm SD	50
Table 6.2 A: Motion stereotype (% of respondents) for Rotary control-Analog display operation of all the adult subjects	54
Table 6.2 B: Motion stereotype (% of respondents) for rocker switch-electric light unit operation of all the adult subjects	55
Table 6.2 D: Index of reversibility (IR) of all the control-display units for adults	56
Table 6.2 E: Mean response initiation time (ms) of adult for operation of all the control display units	57
Table 6.2 F: Comparison of motion stereotype (% of respondents) for Rotary control-Analog display operation between adult male and female subjects	57
Table 6.2 G: Comparison of motion stereotype (%) for rocker switch-electric light unit operation among between the adult (n=2600) male and female (n=2628) subjects	58
Table 6.2 H: comparison of Index of reversibility (IR) between the adult male and female for all analog display tested in the study	59
Table 6.2 I: Comparison of motion stereotype (%) for digital display operation between the adult male and female	60
Table 6.2 J: comparison of Index of reversibility (IR) for all the digital displays between the adults male and female	61
Table 6.2 K: Mean response initiation time (ms) of adult male and female subjects for operation of the entire control display units.	62
Table 6.2 L: Comparison of Motion stereotype (% of respondents) for Rotary control-Analog display operation between adult and children	63
Table 6.2 M: Comparison of Motion stereotype (%) for rocker switch-electric light unit operation between adult and Children	63
Table 6.2 N: Comparison of Index of reversibility (IR) for all the analog control-display units between adult and children	64
Table 6.2 O: Comparison of motion stereotype (%) for digital display operation between adult subjects (n=4887) and children subjects (n=386)	65
Table 6.2 P: Comparison of Index of reversibility (IR) for all the digital displays between adults (n=4887) and children (n=386)	67
Table 6.2 Q: Comparison of Mean response initiation time (ms) between adult and children subjects during operation of the entire control display unit	67
Table 6.2 R: Pattern of motion stereotypes found in the study for Bengali (Indian) population (adult and children)	78
Table 6.2 S: Comparison of general stereotypes found for two similar control-display	68

units among Chinese, American (Yu and Chan, 2004) and Bengali (Indian) population	
Table 6.3 A: Percentage (%) of color stereotype (for different criteria) among all the subjects (n=3627)	75
Table 6.3 B: Comparison of color stereotype (percentage of respondents) for criterion I between male (n=1987) and female (n=1640) subjects	77
Table 6.3 C: Comparison of color stereotype (percentage of respondents) for criterion II between male (n=1987) and female (n=1640) subjects	78
Table 6.3 D: Comparison of color stereotype (for criterion III) percentage (%) between male (1987) and female (1640) subjects	79
Table 6.3 E: Comparison of color stereotype (for concept IV) percentage (%) between male (1987) and female (1640) subjects	80
Table 6.3 F: Comparison of color stereotype (percentage of respondents) for criterion I (thermal sensation of colour) between females of urban and rural areas	81
Table 6.3 G: Comparison of color stereotype (percentage of respondents) for criterion II (colour impression for on and off response) between females of urban and rural areas	82
Table 6.3 H: Comparison of color stereotype (percentage of respondents) for criterion III (colour for safe and danger zones) between females of urban and rural areas	83
Table 6.3 I: Comparison of color stereotype (percentage of respondents) for concept IV (colour for traffic signal) between females of urban and rural areas	84
Table 6.3 J: Comparison of color stereotype (percentage of respondents) for concept I (thermal sensation of colours) between males of urban and rural areas	84
Table 6.3 K: Comparison of color stereotype (percentage of respondents) for concept II (colours for on and off response) between males of urban and rural areas	86
Table 6.3 L: Comparison of color stereotype (percentage of respondents) for concept III (colour for safe and danger zones) percentage (%) between males of urban and rural areas	87
Table 6.3 M: Comparison of color stereotype (percentage of respondents) for concept IV (colour for traffic signal) between males of urban and rural areas	88
Table 6.4 A: Classification stress according to CSI values	91
Table 6.4 B: Heart Rate in resting (n=44) and after work (n=44) condition	92
Table 6.4 C: Percentage of workers under different cardiovascular stress levels	92
Table 6.4 D: Response initiation time (ms) for control display operation at different stress levels	92
Table 6.4 E: Comparison of direction of motion stereotype (% of respondents) of the factory workers for different sets of rotary control- display operation at normal resting state and different levels of physiological stress	93
Table 6.4 F: Comparison of direction of motion stereotypes (% of respondent) of the factory workers for different sets rocker switch-electric light operation (“on” response) at normal resting state and different levels of physiological stress	94
Table 6.4 G: The indexes of reversibility (IR) for all the control-display configurations in different stress conditions	95
Table 6.4 H: Percent difference of IR of the subjects from different stress level for all the control-display units operation	95

Table 6.4 I: Thermal parameters recorded during different bell metal processing jobs	99
Table 6.4 J: Comparison of Motion stereotype (% of respondents) of the subjects without heat stress and the subjects at higher heat stress for different sets of rotary control -analog display units	100
Table 6.4 K: Comparison of motion stereotype (% of respondents) of the subjects without heat stress and the subjects at higher heat stress for different sets of rocker switch-electric light unit operation	101
Table 6.4 L: Comparison of index of reversibility (IR) of the subjects from high heat stress and no heat stress for rotary control analog display units operation	101
Table 6.4 M: comparison of mean response initiation time (sec) for all control-display unit operation	102
Table 6.4 N: Distribution of the subjects (n=100) according to the OSI (occupational stress index) scores (Srivastava and Singh, 1984)	104
Table 6.4 O: Motion stereotype (% of respondents) of the subjects under low, moderate and high job related psychological stress for the operation of rotary control-analog display	104
Table 6.4 P: Motion stereotype (% of respondents) of the subjects under low, moderate and high job related psychological stress for the operation of different rocker switch-electric light unit operation	105
Table 6.4 Q: Motion stereotype (% of respondents) of the subjects under low, moderate and high job related psychological stress for the operation of different digital display unit operation	106
Table 6.4 R: Mean Response Initiation time (ms) of the subjects under low, moderate and high job related psychological stress for the operation of all the control-display unit operation	107
Table 6.4 S: Index of Reversibility (IR) of the subjects under low, moderate and high job related psychological stress for the operation of all the control-display unit operation	107
Table 6.5 A: Direction of motion and chosen position (Y-ZR, Y-ZL , X-Y, X-Z Plane) of rotary switches for the operation of digital and analog display with spatially arranged rotary switches for adult male (n=250) and female (n=250) subjects	112
Table 6.5 B: Index of Reversibility of adult male (n=250) and female (n=250) subjects for the operation of digital and analog display with spatially arranged rotary switches	113
Table 6.5 C: Mean response initiation time (ms) of adult male (n=250) and female (n=250) subjects for the operation of the digital and analog display with spatially arranged rotary switches	114
Table 6.6 A: According to hand grip strength frequency and percentage of left handed and right handed subjects	116
Table 6.6 B. Comparison of motion stereotype (%) between right hander and left hander adult subjects (n=1000) for different sets of rotary control- display combinations	117
Table 6.6 C: comparison of motion stereotype (%) between right hander and left hander adult subjects (n=1000) for different sets of digital displays	118
Table 6.6 D. comparison of motion stereotype (%) between the right hander and left	119

hander adult subjects (n=1000) for different sets of rocker switch-electric light combinations	
Table 6.6 E: Comparison of the index of reversibility (IR) of right hander and left hander adult (1000) subjects for all the control-display configurations tested in this study	120
Table 6.6 F: Percent (%) difference of IR of right hander and left hander subjects for all the control-display configurations tested in this study	121
Table 6.6 G: Mean Response Time (ms) of the right hander and left hander subjects for the operation of all the control display units	122
Table 6.7 A: Classification of the adult (n=5228) subjects according to modified B. G. Prasad Socio economic scale (Singh et. al, 2017)	125
Table 6.7 B: Variation in motion stereotype (% of respondents) of the adult male subjects (n=2600) from different social class for Rotary control-Analog display operation	125
Table 6.7 C: Variation in motion stereotype (% of respondents) of adult male (n=2600) subjects from different social class for all the rocker switch- electric light unit operation	127
Table 6.7 D: variation in Index of reversibility (IR) of the adult male (n=2600) subjects from different social class for all the control-display units operation	128
Table 6.7 E: Percent difference of IR of all the adult male (n=2600) subjects among different social classes for all the control-display units	128
Table 6.7 F: Mean response initiation time (ms) of adult male (n=2600) subjects during operation of all control display units	129
Table 6.7 G: Variation in motion stereotype (% of respondents) of the adult female (n=2628) subjects from different social class for rotary control-Analog display operation	130
Table 6.7 H: Variation in motion stereotype (% of respondents) of the adult female (n=2628) subjects from different social class for all the rocker switch- electric light unit operation	131
Table 6.7 I: Index of reversibility (IR) of all the adult female (n=2628) subjects from different social class for all the control-display units operation	131
Table 6.7 J: Percent (%) difference of IR values of all the adult female (n=2628) subjects between different social classes for all the control-display units operation	132
Table 6.7 K: Comparison of mean response initiation time (ms) of the female subjects from all the social class for operation of all the control display units	133
Table 6.8 A: Classification of the adult (n=5228) subjects according to their educational level	137
Table 6.8 B: Variation in motion stereotype (% of respondents) of the adult male (n=2600) subjects from different education levels for Rotary control-Analog display operation	138
Table 6.8 C: Variation in motion stereotype (% of respondents) the adult male (n=2600) subjects from different education level for rocker switch- electric light unit operation	139
Table 6.8 D: Mean response initiation time (ms) of adult male (n=2600) subjects during operation of all control display units	140
Table 6.8 E: The Index of reversibility (IR) of the adult male (n=2600) subjects from different education levels for all the control-display units operation	140

Table 6.8 F: Variation in motion stereotype (% of respondents) the adult female (n=2628) subjects from different education levels for Rotary control-Analog display operation	141
Table 6.8 G: Motion stereotype (%) for rocker switch- electric light unit operation among all the adult female (n=2628) subjects	142
Table 6.7 H: Mean response initiation time (ms) of adult female (n=2628) subjects during operation of all the control display units	142
Table 6.8 I: Index of reversibility (IR) for all the control-display units of all the adult female (n=2628) subjects	143
Table 6.9 A: distribution of the rural and urban male and female subjects in the studied population	145
Table 6.9 B: Motion stereotype (%) of rural and urban subjects for different sets of rotary control- display combinations	146
Table 6.9 C: Motion stereotype (%) of rural and urban subjects for different sets of rocker switch-electric light combinations	148
Table 6.9 D: Comparison of the index of reversibility (IR) of rural and urban subjects for all the control-display configurations tested in this study	149
Table 6.9 E: Percentage (%) difference of IR of rural and urban subjects for all the control-display configurations tested	149
Table 6.9 F: Mean Response Time (ms) of the rural and urban subjects for the operation of all the control display units	150
Table 6.10 A: Gender distribution (frequency and percentage) of the subjects volunteered for the study	154
Table 6.10 B: Direction of motion stereotype (%) of all the subjects for completing the tasks assigned to them	157
Table 6.10 C: Response initiation time (ms) of all the subjects for completing the tasks assigned to them	157
Table 6.10 D: Response (%) of the subjects for the questions asked to them for modification of conventional gas oven control	159
Table 6.10 E: Comparison of Direction of motion stereotype (%) for the gas oven nonusers for operation of conventional and modified gas oven operation	163
Table 6.10 F: Comparison of Response initiation time (ms) of the non user of gas oven for operation of conventional and modified gas oven operation	163
Table 6.10 G: Comparison of Direction of motion stereotype (%) of the regular users of gas oven for the operation of conventional and modified gas oven burner	164
Table 6.10 H: Comparison of Response initiation time (ms) of the regular users of gas oven for operation of conventional and modified gas oven burner	165
Table 6.10.I: Comparison of % of error during completing assigned tasks of gas oven operation between gas oven users and gas oven non users for conventional and modified gas oven	166
Table 7.A: Dominant colour preference/ colour stereotypes of the Bengali (Indian) population	170
Table 8.A: control-display units fabricated and tested in the present study	174
