

## List of Tables

<b>Table No.</b>	<b>Name of the Tables</b>	<b>Page No.</b>
Table 4.1	Cutoff values of systolic (SBP) and Diastolic (DBP) blood pressure for classifying the subjects (Chobanian et al., 2003)	27
Table 4. 2	GOLD Spirometric Criteria for COPD Severity	38
Table 5.1	Frequency (f) percentage (%) of educational status of the carpenters (n=256)	46
Table 5.2	Economic status of carpenters	46
Table 5.3	Socioeconomic status of carpenters according to the modified Kuppuswami Scale (Raj et al, 2015)	47
Table 5.4	The physical characteristics of the carpenters (n=256)	49
Table 5.5	Frequency (f) and percentage (%) of carpenters (n=256) showing different levels of Chronic Energy Deficiency (CED) according to BMI	50
Table 5.6	Mean $\pm$ SD of body composition Parameters of carpenters (n=256).	52
Table 5.7	Correlation coefficient (r) between BMI and other body composition parameters -body density, body fat%, total body fat and lean body mass	52
Table 5.8	Mean $\pm$ SD of blood pressure of the carpenters (n=256)	53
Table 5.9	Frequency (f) and percentage (%) of carpenters of different blood pressure categories	53
Table 5.10	Frequency (f) and percentage (%) of musculoskeletal disorders (MSD) in the different body segments of the carpenters during performing different tasks	55
Table 5.11	Frequency (f) and percentage (%) of musculoskeletal disorders (MSD) among three groups of the carpenters according to their work experience (Ex. I: experience =1 – 5 years ; Ex. II: experience =6 – 10 years ; Ex. III: experience = > 10 years )	56
Table 5.12	The Body part discomfort (BPD) rating (Mean $\pm$ SD) in different body segments of the carpenters during performing different carpentry tasks (in a 10 point scale).	62
Table 5.13	The Mean $\pm$ SD of Body part discomfort (BPD) rating (in a 10 point scale) in different segments of the body of three groups of the carpenters according to their work experience (Ex. I: experience =1 – 5 years; Ex. II: experience =6 – 10 years; Ex. III: experience = > 10 years)	63
Table 5.14	Mean $\pm$ SD of work time and rest time (minute) of workers in different carpentry tasks	67

<b>Table No.</b>	<b>Name of the Tables</b>	<b>Page No.</b>
Table 5.15	Mean $\pm$ SD, percentage (%) of different categories of rest pauses (in minute) in different carpentry tasks	68
Table 5.16	Percentage (%) and Mean $\pm$ SD of work time for different work posture adopted by carpenters	71
Table 5.17	Action and risk levels of postural analysis of all carpentry tasks by different methods	76
Table 5.18	Percentage of carpenters belonging to different action categories (AC) in different tasks according to three methods	77
Table 5.19	Postural analysis by QEC method: scores and risk levels in different carpentry tasks	77
Table 5.20	Centre of gravity (expressed as % of the length of the body) of the carpenters in different carpentry tasks	80
Table 5.21.A	Mean and standard deviation EMG RMS values ( $\mu$ V) of different arm muscles of carpenters in normal standing and three different working conditions (n=30)	82
Table 5.21.B	Mean and standard deviation EMG RMS values ( $\mu$ V) of shoulder and back muscles of carpenters in normal standing and three different working conditions (n=30)	83
Table 5.22	Categorization of work level on the basis of mean working heart rate (Sari et al., 2016)	86
Table 5.23	Resting and working heart rates in three different carpentry tasks	87
Table 5.24	Classification of cardiovascular stress index (CSI) by Brant, (2009)	88
Table 5.25	Mean $\pm$ SD of Cardiovascular Stress Index (CSI) of carpenters during different carpentry tasks	88
Table 5.26	Mean $\pm$ SD of CSI and % of work and rest periods of total work shift in different carpentry tasks.	89
Table 5.27	Comparison of CSI between workers of present study and workers of other study	89
Table 5.28	Mean $\pm$ SD and range of pulmonary function parameters of carpenters	91
Table 5.29	Pulmonary function parameters of three groups of the carpenters according to their work experience (Ex. I: experience =1 – 5 years; Ex. II: experience =6 - 10 years; Ex. III: experience = > 10 years)	91
Table 5.30	Comparison of pulmonary functions (Mean $\pm$ SD) between smoker and non-smoker carpenters (n=256)	92

<b>Table No.</b>	<b>Name of the Tables</b>	<b>Page No.</b>
Table 5.31	Comparison of pulmonary functional variables (Mean $\pm$ SD) of carpenters with other workers	93
Table 5.32	Severity of COPD in workers according to their work experience (n=60) (Ex. I: experience =1 – 5 years; Ex. II: experience =6 - 10 years; Ex. III: experience = > 10 years)	93
Table 5.33	Physical characteristics of collected conventional chisels	96
Table 5.34	Percentage of carpenters (chisel users) reported musculoskeletal problems in different parts of the body during using existing chisel	97
Table 5.35:	Types and occurrence of overall pain / discomfort of the chisel users (n=33) [Frequency and percentage (%)]	99
Table 5.36	User gratification regarding physical dimensions of handle of the existing chisel (n=33)	101
Table 5.37	User satisfaction regarding shape and gripping of handle of the existing chisel (n=33)	101
Table 5.38	User preference (%) for the range of dimensions, shape and grip of the existing chisel (n=33)	102
Table 5.39	Anthropometric measure and percentile values of different hand dimensions of the chisel users (n=70)	104
Table 5.40	Physical dimensions and other criteria of four prototype models of chisel	106
Table 5.41	Score assigned by the subjects (n=10) for handle length during performing paired comparison test	108
Table 5.42	Resultant score of paired comparison test for handle length computed from Table5.41	108
Table 5.43	Resultant score of paired comparison test for handle diameter of chisel Parameter: Handle diameter of chisel.	109
Table 5.44	Resultant score of paired comparison test for shape of the chisel handle Parameter: shape of the chisel handle	111
Table 5.45	Resultant score of paired comparison test for Grip of the chisel handle Parameter: Grip of the chisel handle	113
Table 5.46	Resultant score of paired comparison test for grip pad of the chisel handle	114
Table 5.47	Selection of recommended dimensions of handle of tong on the basis of body dimensions and the results of pair comparison test.	117

<b>Table No.</b>	<b>Name of the Tables</b>	<b>Page No.</b>
Table 5.48	Subjective assessment for modified chisel (figure in the parentheses indicated percentage)	119
Table 5.49	Percentage of incidence of discomfort/ pain in different body parts of chisel users (n=25) during handling existing and modified chisel	120
Table 5.50	Resting and working heart rates and CSI of chisel users (n=25) during operation of existing and modified chisel	121
Table 5.51	Cost analysis for modified chisel	123
Table 5.52	Physical dimension of workstation used by carpenters during planning task	125
Table 5.53	Frequency and Percentage of carpenters reported musculoskeletal problems during performing task in the existing workstation	127
Table 5.54	Types and occurrence of pain / discomfort during performing task in the existing workstation (n=24) [Frequency and percentage (%)]	127
Table 5.55	User satisfaction (Percentage of subjects) on physical dimensions of existing workstation (n=24)	128
Table 5.56	Anthropometric measures and Percentile values of the workstation users (n=70) in carpentry task	129
Table 5.57	Height of existing and modified workstations:	130
Table 5.58	Comparison between Physical dimensions of workstation and anthropometric measures	130
Table 5.59	Body part discomfort (BPD) rating (Mean $\pm$ SD) of carpenters during working in existing and modified models of workstation(n=24)	132
Table 5.60	Different body joint angles (Mean $\pm$ SD) of carpenters working in existing and modified workstation with different heights (n=24)	134
Table 5.61	Deviation of different body joint angles of carpenters working in workstation with different height from normal erect posture(n=24)	135
Table 5.62	Mean and SD of EMG-RMS values ( $\mu$ V) of shoulder muscle of carpenters (plane users) working in existing and threemodified workstations of different heights(n=10)	136
Table 5.63	Mean and SD of EMG-RMS values ( $\mu$ V) of back muscle of carpenters (plane users) working in existing and three modified workstations with different heights(n=10)	137
